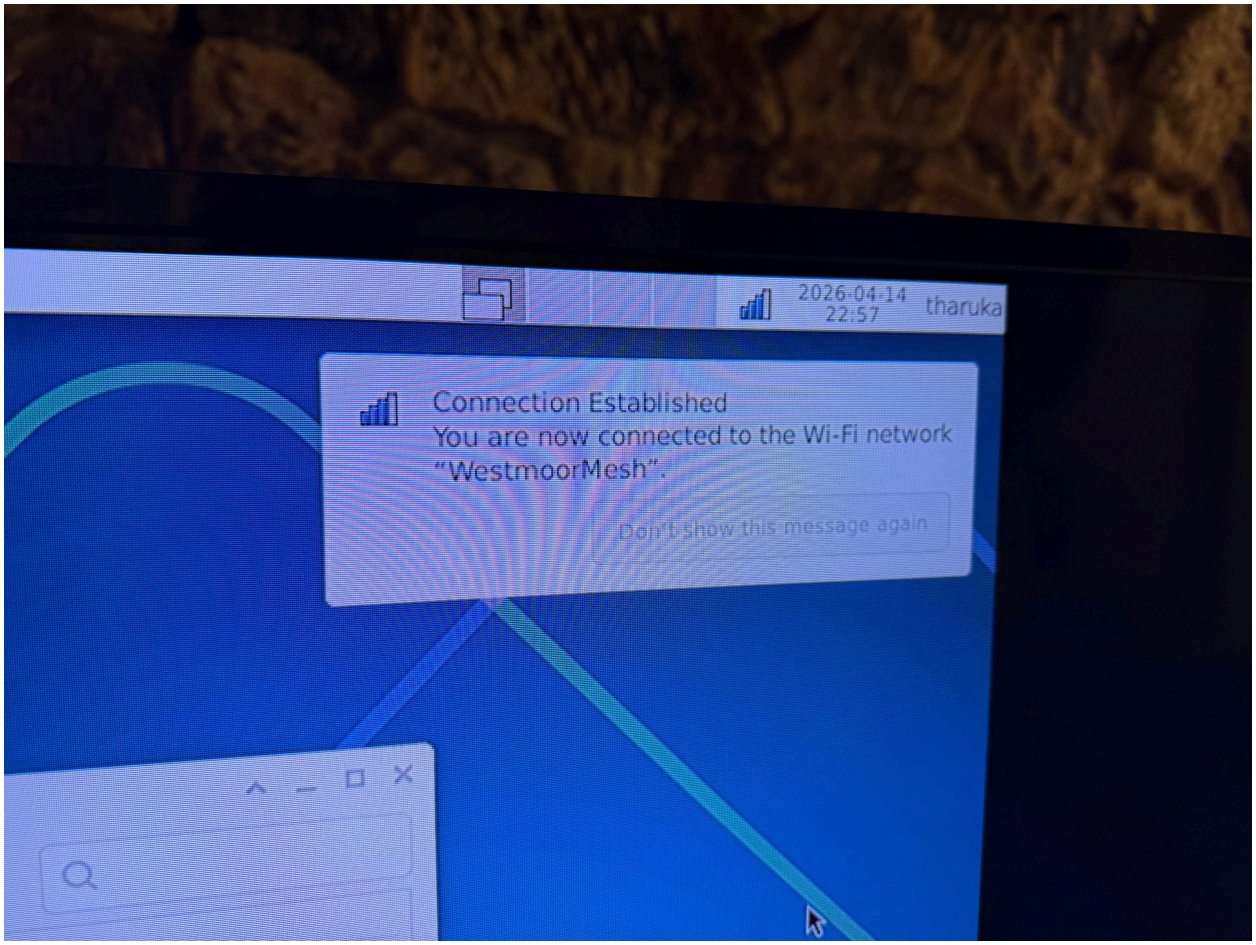
Lab 1, CSE121, Spring '26

Lab Setup, and Hello World

Instructor: Marcelo Siero

Author: Tharuka Kodituwakku

WiFi Connection, at home, 5ghz network, same functionality as lab network



Part 1.0

Went to BELS, checked out an ESP32 kit and a Raspberry Pi kit.

Part 1.1

I have past experience with imaging SD cards, and setting up Raspberry Pis. I owned a Raspberry Pi 3 as a kid. I have a dualboot system on my laptop, so my laptop ran out of storage. I spent some time rearranging the partition sizes so I could install the necessary imaging tool. That took a significant amount of time. Another hurdle I had to overcome was getting the OS to automatically start XFCE on startup, rather than sending me to the CLI every time.

Part 1.2

I was able to complete this on the Raspberry Pi with minimal issues. The Raspberry Pi was somewhat slow and cumbersome to use. My personal laptop also has Ubuntu 24.04 on it, so I ran the exact same steps on it to test.

Part 1.3

The same repository that provided the *hello world* example also has a flashing LED example that meets the requirement of this part. I had to specify the correct GPIO pin to use.

AI Usage

I did not use AI on this lab.
